

CLOUD DELIVERY OF ATSC 3.0 VIA SECURE RELIABLE TRANSPORT

JOE SECCIA, PRINCIPAL ARCHITECT

TELEVISION TRANSMISSION

GATESAIR MOTIVATION (1)

VIRTUAL events

- Evolving to NextGen TV is unlike the NTSC – DTV conversion.
 - Channel sharing with host and guest stations
 - Likely to involve disparate locations of contributors and transmissions
- Many architectures and ideas have been floated regarding delivering NextGen TV to consumers.
 - Classic single transmission site
 - Single Tx augmented with SFN fillers
 - Completely distributed SFN architecture
 - Gap fillers as necessary

- The change to shared infrastructure brings opportunity to evolve distribution to transmitter sites.
- Classic “one studio, one transmitter site” paradigm is shifting.
- High speed connectivity is on the rise everywhere.
- Broadcasters are moving to cloud encoding today.
 - OpEx vs. CapEx
 - COTS server hardware today is extremely powerful.
- COVID-19 is teaching us the extent of things we can do with broadband connectivity and accelerating plans of moving to the cloud.

WHY SECURE RELIABLE TRANSPORT (SRT)

- **Secure**: Encrypts content in accordance with AES 128, 256
- **Reliable**: Recovers from severe packet loss
- **Transport**: Dynamically adapts to changing network conditions.
- Designed for high quality, secure, low latency transport of video over public internet via modified UDP based Data Transfer Protocol (UDT).
 - TCP guarantees delivery, but control of latency and buffering are concerns.
 - UDP gives high throughput and low latency but no delivery assurance.
 - SRT incorporates innovative technology to overcome UDP's "best effort" reputation.
- Scalable
- Firewall friendly
- Open Source: Community can extend and enhance.

GATESAIR SRT ALLIANCE

VIRTUAL events

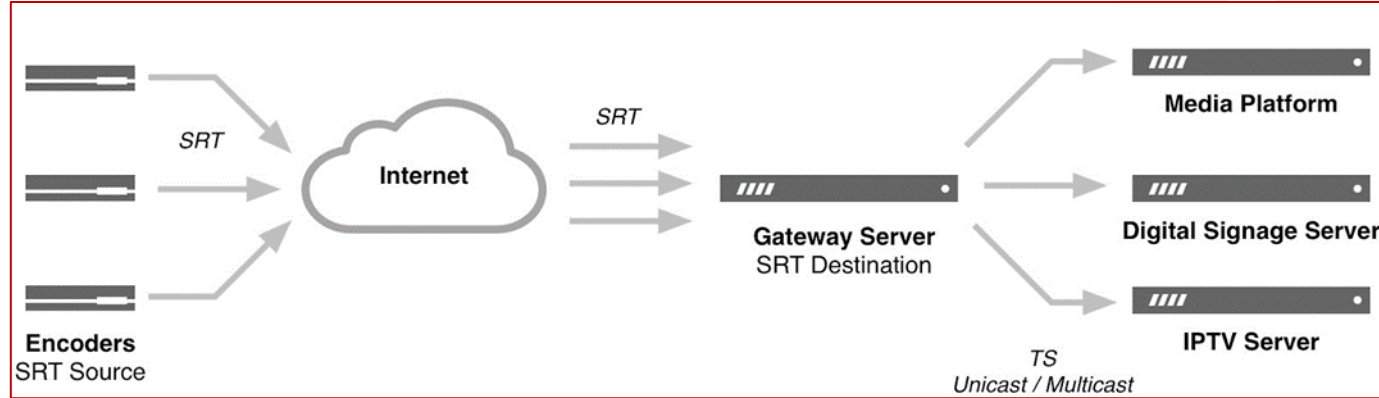

Haivision

- SRT is a connection-oriented protocol.
- Provides transport of media and control messages.
- Caller, Listener, Rendezvous modes to establish handshake
 - Independent of Source and Destination

SRT FLEXIBILITY / SCALABILITY

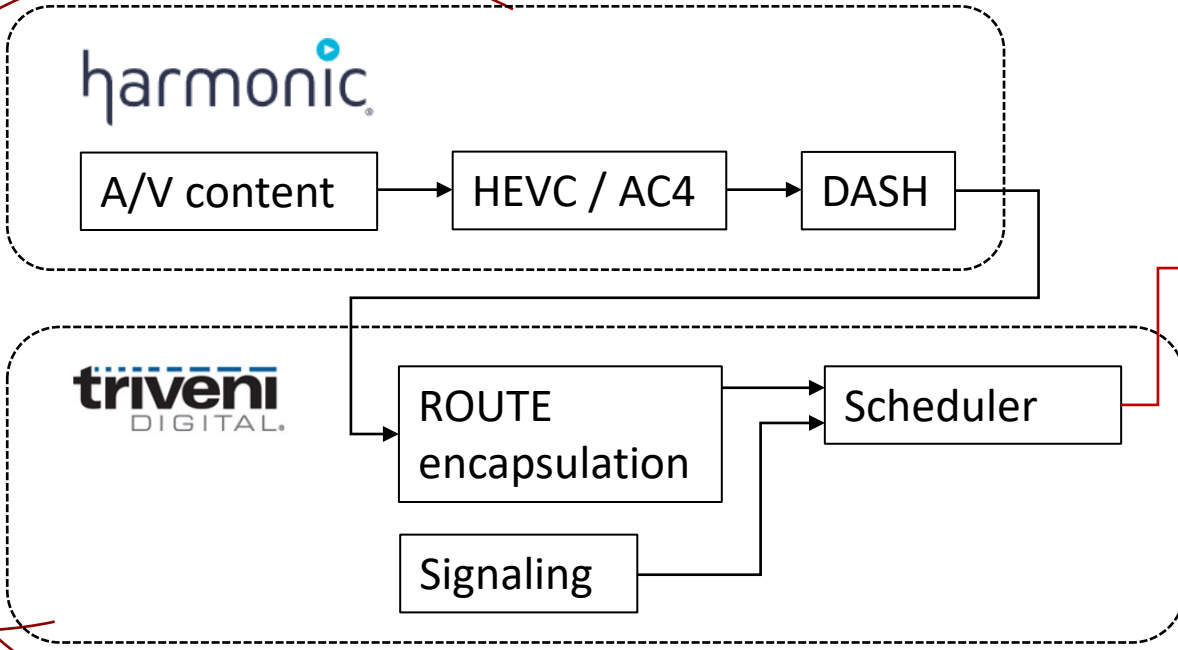

- Multiple sources
- Multiple destinations

- ATSC A/324 STL standard was originally multicast-only
- Recent update added unicast to accommodate for smaller internet providers that may have difficulty in properly provisioning for multicast traffic.
- Security of A/324 transport is evolving, however it is rooted in norms of the broadcaster having physical presence at each end of the STL.
 - Not necessarily cloud friendly
 - Authentication, not encryption.

MITIGATING NETWORK IMPERFECTIONS

- Secure Reliable Transport
- SMPTE-2022 Forward Error Correction
- Network Diversity

GATESAIR SRT MITIGATIONS

VIRTUAL events

- Within SRT's algorithms are measures to mitigate the effects of delays, jitter and packet loss.
- Large buffers help, but at the expense of latency.
- SRT implements a mechanism that recreates the input signal characteristics on the receive side, which serves to reduce the need for buffering.

SOME SRT TERMINOLOGY: TRANSMIT SIDE

- Resent Packets: Number of packets retransmitted based on reports from the destination device.
- Dropped Packets: Number of Packets reported missing by the destination device. (Raw number dropped by the network.) These may be recovered by retransmission by the source. In the SRT streaming paradigm, these do not necessarily result in video artifacts.

The screenshot displays the SRT streaming software interface. At the top, there are tabs for 'Basic', 'Advanced', and 'Status'. The main window shows a stream titled 'Stream "To Mason"' which is 'In Service'. Below this, there are several status indicators: 'Connection State' is 'Connected', 'RTP State' is 'Up', 'Stream Up Time' is '0 d 18 h 39 m 43 s', 'Stream Rate' is '13928 kbps', 'Creation Date' is 'Wed Apr 15 13:18:32 2020', and 'Last Modified' is 'Wed Apr 15 14:19:27 2020'. A 'Disconnect' button is visible. The 'Stream Statistics' section shows 'Destination 1' selected. The 'Local Packet Statistics' section includes 'Reconnections' (0), 'Encryption State' (No Secret), and 'RTT' (48.583000). A red box highlights the 'Resent Packets' (4892230) and 'Dropped Packets' (6965696) fields.

Stream	Connection State	RTP State	Stream Up Time	Stream Rate	Creation Date	Last Modified
Stream "To Mason"	Connected	Up	0 d 18 h 39 m 43 s	13928 kbps	Wed Apr 15 13:18:32 2020	Wed Apr 15 14:19:27 2020

Local Packet Statistics	Value
Reconnections	0
Encryption State	No Secret
RTT	48.583000
Resent Packets	4892230
Dropped Packets	6965696

SOME SRT TERMINOLOGY: RECEIVE SIDE

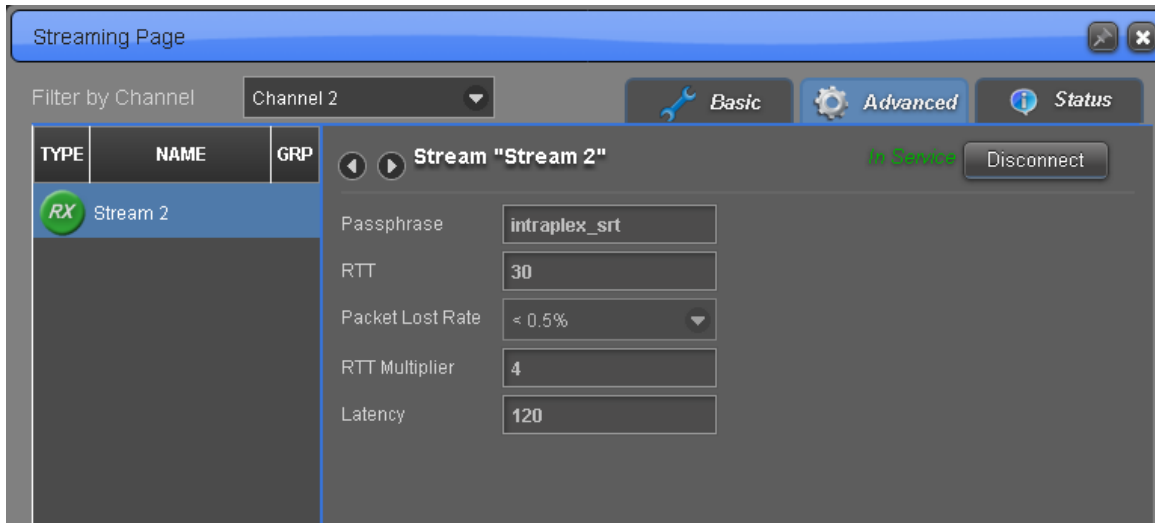

- Lost Packets: Number of packets reported missing by the decoder.
- Skipped Packets: Packets that have arrived at the receive side too late or never at all.
 - If the time_to_play a packet has passed
 - Not at the decoder yet
 - Content it is associated with already played
 - Reported as skipped.
 - In SRT paradigm of video streaming, results in video artifact.

The screenshot shows a software interface for monitoring a stream. At the top, there are tabs for 'Basic', 'Advanced', and 'Status'. Below the tabs, the stream is identified as 'Stream "Stream 1"' and is currently 'In Service'. A 'Disconnect' button is visible. The interface displays various statistics:

Connection State	Connected	RTP State	Up
Stream Up Time	1 d 17 h 46 m 46 s	Stream Rate	13704 kbps
Creation Date	Wed Apr 15 16:11:31 2020	Last Modified	Wed Apr 15 16:12:18 2020

Below this, there is a section titled 'Local Packet Statistics' which is highlighted with a red box. It contains the following data:

Reconnections	18	Lost Packets	61763
Encryption State	Unsecured	Skipped Packets	1341
RTT	41.408000		

- Passphrase: Used for AES encryption.
- RTT: Round Trip Time for packets on the link.
- RTT Multiplier: Controls stream latency factor, can be set with an estimated packet loss rate for the link.
- Latency: Determines how long to keep packets for retransmission.

- SRT's paradigm for streaming video involves managing factors of RTT, Latency, link bandwidth / dynamics as well as encoder rates.
 - This works well with streaming video.
 - SRT guides implementers on how to use ping or other network tool to help with RTT, packet loss rate, latency, etc. to set up buffers appropriately to achieve desired link performance.
- ATSC 3 A/324 STL link is:
 - Constant bit rate, set by physical layer parameters set up in the Scheduler
 - Good news: We know what it is and can lock down QoS and desired overhead with provider, etc.
 - **Intolerant to packet loss.**

SMPTE-2022 FORWARD ERROR CORRECTION

- ATSC A/324 specifies SMPTE-2022-1 Forward Error Correction
- ST-2022 FEC can be added to the SRT tunnel via *UDP Multiplexing* to be used by the ATSC 3 exciter.

Input UDP Source

ID	STATE	IP ADDRESS	PORT	INTERFACE	BITRATE		
1		Multicast	239.0.0.7	8007	DATA	9488 kbps	
2		Multicast	239.0.0.7	8009	DATA	2392 kbps	
3		Multicast	239.0.0.7	8011	DATA	1592 kbps
